

## Agile-Sync™ lets you bypass the risks that plague “big bang” conversions.

A lot of what we do at Osprey Software Development involves building new systems for clients and replacing legacy mission-critical systems that either can't get the job done, or don't do it effectively. But although often outdated, in-place systems are vital to our clients' day-to-day business operations, meaning that every overhaul must be managed carefully—and thoughtfully.

That's where our *Agile-Sync Development Kit™* comes into play, our distinctive answer to a longstanding problem related to shepherding successful conversions. It's like changing out the engine while you're still behind the wheel, driving.

### Why it Works

- ✔ Controlled, steady usability
- ✔ Individual migration
- ✔ Synchronized live data

---

*Our technology lets you maintain control and protect your business. So let us help make your next overhaul, a smooth one.*

---

We take a gradual approach that reduces risk, **handing off business processes and data one piece at a time** from the legacy system to the new system.

It also allows you to maximize business impact by **turning on the most powerful portions of your new system, first**.

This means you can **manage deployment-related risks** that could impact your business.

Even better? **New functionality can be made available in stages**, meaning your users don't have to wait before benefitting from improved performance and functionality.

For the duration of the conversion process, both systems run side-by-side, with all **live data synchronized**—so you don't skip a beat.

We conduct **thorough testing at each phase** so there are no surprises once we're finished.

**Osprey's Agile-Sync Development Kit sets a new standard for re-platforming mission-critical applications. Our track record of satisfied clients speaks to our extensive experience building customized software systems, as well as the superior talent and technical expertise of our development and delivery teams.**
